                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated mammalian (e.g., human or mouse) CC lipase polypeptide (polyp), e.g., LPDL (I) or LPDLR polyp (II). (I) or CC (II) is useful for identifying substances which can bind with LPDL or CC LPDLR polyp, and for identifying a compound that affects the binding of LPDL or LPDLR polyp and an LPDL or identifying a compound that affects the binding of CC their nucleic acid is useful for identifying a compound that affects LPDL or LPDLR polyp activity or expression. (I) or (II) or their nucleic acid is useful for detecting or monitoring a condition associated with CC increased or decreased LPDL or LPDLR expression or activity in an animal, CC where the condition is lipase deficiency, atherosclerosis, fatty liver CC disease and dyslipidemias, such as hypercholesterosis, fatty liver CC deficient states, and/or any other tissue or plasma disorders of lipid or CC inpoprotein metabolism. The nucleic acid is useful for diagnosing the CC expending a germline alteration in the nucleic acid in the CC involves detecting a germline alteration in the nucleic acid in the CC inhibiting expression or activity of (I) or (II). The nucleic acid is useful for as a probe or primer. The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The YAC probes are used CC to isolate the nucleic acid sequences of the invention. The specification CC describes nucleic acid sequences derived from a eukaryotic chromosome, cC including a neocentromere or its functional derivative or hybrid, that CC are able, in a compatible cell, of replicating, acting as extractive or sector and segregating during cell division. The sequences CC chromosomal element and segregating during cell division. The sequences CC can be used to construct artificial chromosomes for use in gene therapy CC comprising a replicable, segregating nucleic acid that confers a specific CC phenotype on cells. Human artificial chromosomes can propagate in human CC cells and carry large amounts of DNA (e.g. therapeutic genes), and, being CC extra-chromosomal, they are not mutagenic. The artificial chromosomes are CC also useful for generation of transgenic plants and animals, in CC expression of cytokines, receptors and growth factors, or to increase the CC copy number of a gene in a cell. The constructs may also be used for CC functional and structural analysis of chromosomes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
AAT39826-T39833 represent amplification primers used to amplify the autonomously replicating DNA sequence (ARS) represented by AAT39825. The primers were used to amplify successively smaller regions of the HeLa HSP70 gene (including the 5' untranslated region) to obtain the ARS. The primer set designated A (AAT39826) amplified the largest HSP70 gene fragment. The next largest fragment was amplified by primer set D (AAT39827 and AAT39828), then set B (AAT39829 and AAT39830), and set C (AAT39831 and AAT39832) amplified the sequence shown in AAT39825. The sequences amplified by these primers all contained the HSP-MYC-A and HSP-MYC-B regions. The amplified ARS sequence is inserted into a plasmid which is then capable of autonomous replication in an episome state in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Autonomous replication; episome; transgenic animal; mammal; human; PCR; plasmid; peptide production; polymerase chain reaction; primer; amplify; HSP-MYC; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 19 BP; 3 A; 7 C; 4 G; 3 T; 0 U; 2 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         host cells. The replication of this plasmid in the host cells is also very stable. The host cells used are cells derived from mammals, preferably from a human. The plasmid is useful to provide a large amount of heterologous peptide in recombinant cells. The offspring of an animal carrying the gene can be used as peptide producing animals
                                                                                                              Sequence 18
                                                                                                                                                     with anti-infective, anti-inflammatory and cytostatic activity. The oligonucleotides are RIP-1 antisense inhibitors and are used in the diagnosis, prevention and treatment of conditions associated with RIP-1 expression. Conditions associated with RIP-1 expression include various
                                                                                                                                                                                                             This sequence represents an antisense oligonuclectide which binds to the 3' untranslated region of RIP-1. RIP-1 (also known as RalBP1 and RIIP) is a GTPase activating protein (GAP) thought to be a downstream target of Ral. The invention relates to antisense phosphorothicate oligonuclectides
                                                                                                                                                                                                                                                                                      Example 15;
                                                                                                                                                                                                                                                                                                                Antisense inhibition of human RIP-1 expression, useful for diagnosing preventing and treating conditions such as inflammation.
                                                                                                                                                                                                                                                                                                                                                             WPI; 2000-146889/13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 25-SEP-1998;

The invention relates to antisense phosphorothicate oligonucleotides with anti-infective, anti-inflammatory and cytostatic activity. The oligonucleotides are RIP-1 antisense inhibitors and are used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 18 BP; 5 A; 4 C; 5 G; 4 T; 0 U; 0 Other;

The antisense compounds are useful as research agents and diagnostics such as in the elucidation of the function of a particular gene. The antisense compounds can be useful as therapeutic modalities that can be configured to be useful in treatment regimes for treatment of cells, tissues and animals, especially humans. In the prior art, there are no known therapeutic agents which effectively inhibit the synthesis of CREL and additional agents capable of inhibiting CREL function are still required. Sequences AR339588-627 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking complete sites of single nucleotide polymorphisms SNPs. The present invention complete sites for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CC sny flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides and for genotypic traits include diseases e.g. coligonucleotides and acute intermittent porphyria. Phenotypic constants also include symptoms of or susceptibility to multifactorial coligonucleotides and acute intermittent porphyria. Phenotypic coligonucleotides and component is or may be genetic such as autoimmune coligonucleotides and infection by pathogenic inflammation, rheumatoid arthritis, multiple scleronis, and component is or may be genetic solutions and continue multiple scleronis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 1591

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 1592
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPE. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for determining a nucleic acid sample by coligonucleotides are useful for determining the presence, absence or cc oligonucleotides are useful for determining the presence, absence or cc identity of a SNP and for genotyping nucleic acid samples, for e.g. to cligonucleotides are useful for determining the presence, absence or cc individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPS. Phenotypic traits include diseases e.g. cc agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cc disease of which a component is or may be genetic such as autoimmune cc disease of which a component is or may be genetic such as autoimmune cc inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and contentity analysis. The present sequence represents a PCR primer specific for a human SNP containing nNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

CC primer extension (SNPE) primers, and the sequences of regions flanking CC includes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. The persence or absence of a SNP, using the coligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence of coligonucleotides are useful penotypic traits include diseases e.g. coligonucleotides appears the genotypic traits include diseases e.g. coligonucleotides and acute intermittent porphyria. Phenotypic consteogenesis imperfecta and acute intermittent porphyria. Phenotypic consteogenesis imperfecta and acute intermittent porphyria. Phenotypic consteogenesis imperfecta and acute intermittent porphyria. Phenotypic constenses, including, rheumatoid archititis, multiple sclerosis, concerning acute of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic acid sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; Page

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides antisense compounds capable of inhibiting the expression of human Her-3, a member of epidermal growth factor (EEF) family of receptor/tyrosine kinases. The antisense oligonucleotides are useful for inhibiting the expression of Her-3 in cells or tissues. They are commonly used as research reagents and in diagnostics for example, to elicidate the function of particular genes. The antisense compounds are also useful for distinguishing between functions of various members of a biological pathway and for research use. They are also utilized for diagnostics, therapeutics, prophylaxis and in kits. They are useful prophylactically, e.g. to prevent or delay infection, inflammation or tumor formation. Sequences AAH47532-47615 represent chimeric antisense phosphozothioate oligonucleotides having 2.-MOE wings and a deoxy gap,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         member

The present invention describes the human Zmax1 gene and the high mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 a genes have osteopathic activities. The genes can be used in gene t antisense therapy and in the production of vaccines. They can be u
                                                                                                                                                                                                 New high bone mass (HBM) and Zmax1 genes and proteins useful modulating bone mass for the treatment of e.g. osteoporosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; high bone mass; HBM gene; Zmax1 gene; chromosome 11; 11q13.3; sequence tagged site; STS; osteoporosis; osteopathsic; gene therapy; antisense therapy; vaccine; bone disorder; Paget's disease; adapter; sclerostosis; osteomalacia; fibrous dysplasia; PCR primer; linker; s
                                                                                              The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and H genes have osteopathic activities. The genes can be used in gene thera antisense therapy and in the production of vaccines. They can be used the diagnosis and treatment of bone disorders including osteoporosis, paget's disease, sclerostosis, osteomalacia and fibrous dysplasia. ABA82038 to ABA82700 and AAG68168 to AAG68193 represent sequences used

This invention relates to the sequence of an isolated nucleic acid CC molecule comprising at least one base variation from that of a known cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A1), cytochrome P450 A2 (CYP4501A2), CC cytochrome P450 O2E1 (CYP4501E1), adrenergic receptor beta1 (ADBR1), CC cytochrome P450 O2E1 (CYP4501E1), adrenergic receptor beta1 (ADBR1), CC cytochrome P450 O2E1 (CYP4501E1), adrenergic receptor beta1 (ADBR1), CC cytochrome P450 O2E1 (CYP4501E1), adrenergic receptor nuclear translocator CC (ARNT), cathepsin S (CTSS), cytochrome P450 A2 (CYP4501A2), cathepsin S (CTSS), cytochrome passe activating CC inhibitor (DBI), pepxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating CC protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl CC transferase (NNWT), MADPH quinone oxidoreductase 2 (NQO2), could be compared thermolabile (STM), UDP-glucuronosyl transferase 2B4 (CYT2B1), UDP-glucuronosyl transferase 2B7 (GT2B1), UDP-glucuronosyl cransferase (UGT2B1), urokinase receptor (UPA), multidrug resistance 1 (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3 (CRMP3), orphan nuclear receptor (NRNI2), or actylcholine muscarinic creceptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence. CC The polymorphisms in the human genes cited in the invention are useful as genetic linkage markers for locating and characterising the genes that CC are responsible for specific traits within the genome and eventually cidentifying the genes responsible for a variety of disorder-related CC traits as a result of their e.g., overexpression, constitutive captures on the polymorphism in the human genes cited in the invention are useful as constitutive constitutive constitutive constitutive constitutive constitutive constitutive captures on the polymorphism constitutive constitutive captures constitutive captures constitutive captures constitutive captures constitutive captures captures captures captures captures captures captures captures captures capture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        aryl hydrocarbon receptor nuclear translocator; ARNT; cathepsin S; CTSS; cyclooxgenase 2; COX2; diazepam binding inhibitor; DBI; haematological; epoxide hydroxylase 2; EPHX2; 5-lipoxygenase activating protein; FLAP; glutathione-S-transferase 12; GST12; histamine-N-methyl transferase; NNMT; kallikrein 2; KLK2; nicotinamide-N-methyl transferase; NNMT; NADPH quinone oxidoreductase 2; NOO2; sulfotransferase thermolabile; STM; UDP-glucuronosyl transferase 2B1; UDP-glucuronosyl transferase 2B7; UGT2B7; UDP-glucuronosyl transferase; UGT2B15; urokinase receptor; uPA; multidrug resistance associated protein 3; cancer; prostate; acetylcholine muscarinic receptor; CHMR1; CHMR2; CHMR3; CHMR4; CHMR5; altered drug metabolism; cardiovascular function; colorectal tumour; central newtonis system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2002-698522/75
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28-NOV-2000; 2000US-00724389

                                                      cc and/or treating the disorders. The nucleic acid molecules comprising the cpolymorphic sequences contained in CYP4501A1, CYP4501A2, CYP4502E1, CC ARNT, EPHX2, GST12, NNMT, NQO2, NR112, STM, UGT2B4, UGT2B7, UGT2B15, AHR, CC MIRI and/or MIR3 are useful for screening individuals for altered drug metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2, CRPATOLA2, MIR1 and/or MIR3 may also be used to screen individuals for susceptibility to cancer. Polymorphic sequences in ADRB1 or CHWR2 are used to screen for altered cardiovascular function, in COX2 for altered susceptibility to colorectal tumours, in DB1 or CHWR1 for altered central nervous system function, in FLAP and HNMT for altered gulmonary, cc immunological or haematological function, in The prostate, in LTF for altered immunological or protease activity in the prostate, in LTF for altered immunological or cc protease activity in the prostate, in LTF for altered altered central and companies of the colorected contral and companies and colorected contral through the sequence represents a PCR crimer used to amplify the sequences of the invention
Sequence 18 BP; 4 A; 2 C; 8
G; 4 T; 0 U; 0 Other;

diagnosing, treating or preventing e.g., arter: identifying a molecule that binds to high bone corresponding wild type gene. Identifying molecules involved in lipid regulation, useful for arteriosclerosis, mass gene ဝူ comprises

Disclosure; Page 39; 409pp; English.

The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmax1. Compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human Zmax1 cDNA reverse PCR primer #186.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABK23210;
The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmax1. Compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid-associated conditions, including arteriosclerosis, cardiovascular disease, stroke, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, neurovascular
                                                                                                                                                                                     Identifying molecules involved in lipid regulation, useful diagnosing, treating or preventing e.g., arteriosclerosis, identifying a molecule that binds to high bone mass gene of corresponding wild type gene.
                                                                                                                                                                                                                                                                                                                                                   (GENO-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           06-DEC-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WO200192891-A2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    'Anditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmax1 and HBM systems can be used as surrogate markers in pharmaceutical the development, in diagnosis of human or animal bone disease, and in the treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA treatment of bone diseases. Sequences ABK25776-ABK23411 represent cDNA treatment of bone diseases.
                         The present invention describes human NEDL-1 is located to chromosome 7, more specifically to 7p. The present invention also describes a nucleic acid probe comprising: (a) a nucleic acid with a p of the base sequence of the 6200 base pair sequence given in ACC49481 (I), or its complementary base sequence; or (b) a nucleic acid hybridisable with the nucleic acid with a base sequence of (I) or its complementary base sequence under stringent conditions. The NEDL-1 gen and its encoded protein can be used in the diagnosis and prognosis of neuroblastoma. The present sequence represents a PCR primer for GAPDH, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens

                              The invention relates to novel transgenic animals expressing the high CC bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRP5 or LRP6, or expressing CC an LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the situdy of bone density modulation or bone mass modulation. The conclusion has osteopathic and cycostatic activity. The polymucleotides of the invention has osteopathic and cycostatic activity. The polymucleotides of crucheic acids are for the study of bone density modulation. The conclusion may have a use in gene therapy. The transgenic animals and cycostatic acids are transgenic animals of the same compositions in more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The cransgenic animals, nucleic acids and methods are useful for identifying conscules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone compositions, which may be employed for treating and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, conceptuals of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, cor characterised by reduced bone density or mass. The present sequence is considered in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New transgenic animals (e.g. mice), useful as models for studying bone density modulation, developing drugs for treating or preventing bone diseases (e.g. osteoporosis), or diagnosing diseases characterized by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       11-MAY-2001; 2001US-0290071P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Š
                                                     The invention relates to novel transgenic animals expressing the high CC bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRP5 or LRP6, or expressing CC an LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are CC for the study of bone density modulation or bone mass modulation. The cc invention has osteopathic and cytostatic activity. The polynucleotides of CC the invention may have a use in gene therapy. The transgenic animals and CC uncleic acids are for the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals of the same CC species in more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The consciudes involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone CC diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-MAY-2001;

                                                                                                                                                                                                                                   The present invention describes the human BMCC1 protein. The BMCC1 gene has high homology with a part of BNIP2, and is located to the chromosome 9. BMCC1 has cytostatic activity. The BMCC1 protein and its encoded gene are applicable in studying biology, pathology and the onset of cancer. BMCC1 can also be used in the diagnosis prognosis and screening of drugs for tumour e.g. neuroblastoma, including the provision of gene data and protein function on human neuroblastoma. The present sequence represents a PCR primer for human GAPDH, which is used in an example from the

                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                        CC The invention describes a method of determining presence or absence of a CC desired nucleic acid (NA) that contains multiple repeats of a CC providing a treated sample that may contain the desired NA in which CC providing a treated sample that may contain the desired NA in which CC several predetermined repeating NA target sequences are hybridised with a CC NA probe, analysing for presence of hybridised NA containing the MA CC probe, and thereby the presence or absence of the desired NA. The method CC is useful for determining the presence or absence of desired nucleic CC acids that contain multiple repeats of a predetermined NA target CC sequence, in a NA sample obtained from a biological sample, where the CC distinguishing human and bacterial NA. The method is highly sensitive, CC and enables detection and quantification of the presence of a NA without the need to undergo a NA target sequence enrichment step prior to a NA CC hybrid detection SA NA target sequence repeated NA that contains multiple repeats of a NA target sequence. This contains multiple repeats of a NA target sequence. This

The HBM-like phenotype results in bone mass modulation and/or lilevel modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRP5) creater.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          wew nucreic acid comprising a mutation in LRP5 or LRP6, useful diagnosing a HBM-like phenotype in a subject and for preparing composition for modulating bone mass and/or lipid levels in a suffering from e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) context, which was used to prepare a physical map of the Zmax1 (LRP5) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 18 BP; 5
                                 acid.
                                         Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic
                                                                                       WPI; 2003-421160/39.

CC useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more detectable nucleic acid comprises contacting the sample with the mixture of probes (preferably CC comprises contacting the sample with the mixture of probes (preferably CC comprises contacting the sample with the mixture of probes (preferably CC comprises contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or convered detectable nucleic acid probes to the target genomic nucleic of the sample with the one or accell, and the sample is metaphase spreads, interphase nucleic or nucleic control genomic nucleic acid probes to the target genomic nucleic of that of a control sample using a genomic nucleic acid with the order of control genomic nucleic acid, which are differentially labelled, the array or both the sample and control genomic nucleic acid and the array or both the sample and control genomic nucleic acid and the array or both the sample under suitable hybridization conditions, and comparing the array with treated mixture of sample and control genomic nucleic acid with the control genomic nucleic acid acid the array to that caused by hybridization of the probe under suitable hybridization conditions, thus the caused by hybridization of the probes to genomic nucleic acid, thus the caused by hybridization of the probes to genomic nucleic acid, thus the caused by hybridization of the probes to genomic nucleic acid, thus the sample as compared with the relative copy numbers of substantially conditions, and comparing the control. The hybridization of the genomic nucleic acid, thus the sample of genomic nucleic acid that the probability of the sample of genomic nucleic acid that the probability of the sample of genomic nucleic acid hybridization of the genomic nucleic acid hybridization of the genomi

Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic

Claim 10; SEQ ID NO 21; 103pp; English.

that of a control sample using a genomic nucleic acid reference array.

The method comprises treating a sample of genomic nucleic acid and control genomic nucleic acid, which are differentially labelled, the control genomic nucleic acid and the array or both the sample and control genomic nucleic acid and the array with the mixture of the probe under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, and comparing the intensities of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the sample as compared with the relative copy numbers of substantially identical sequences in the control. The hybridization of the genomic array is determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moiety such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable label on the one or more genomic arrays. The genomic array comprises nucleic acid that is prepared from Bacterial Artificial Chromosome (BAC) clones. The present sequence represents a non-nucleotide probe of the invention. for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one more detectable nucleic acid probes to the target genomic nucleic acid probes to the target genomic nucleic acid the sample. The genomic nucleic acid is contained in a fixed tissue or the sample. The genomic nucleic acid is contained in a fixed tissue or the sample. cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The probe is also useful in comparing a sample of genomic nucleic acid with useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay The present sequence represents a non-nucleotide probe. The probe useful for suppressing the binding of one or more detectable nucle probe is nucleic acid a of o

                                                                                                                                                                                                                                                                             Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a kit for diagnosing and treating T-cell consociated diseases which comprises a panel of nucleic acid primers especifically priming and allowing amplification of each Vbeta gene, CC VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant crejection and diagnosing and treating T-cell associated diseases, cincluding autoimmune diseases, hypersensitivity diseases, infectious diseases, careful tversus host diseases, hypersensitivity diseases, infectious diseases, carendary careful associated associated and halpheimer's diseases. Hypersensitivity diseases include multiple sclerosis and Alzheimer's diseases. Hypersensitivity diseases include Type in hypersensitivity diseases include Type and the propersensitivities such as those present in the coordinary careful associated as those caused by caused by viruses such as HTV, fungal infections such as those caused by caused by viruses candida, parasitic infections such as those caused by careful as candida, parasitic infections such as those caused by careful as t

sequence comprising one or more of the nucleotide exchanges (SNP's) given in the specification and at least 8 bases of surrounding sequence of the MCHR1 gene. The composition has anorectic activity. The polynucleotide composition may be used in gene therapy to treat the disorders of the invention. The composition is useful for diagnosing obesity related to the presence of a molecular variant of the MCHR1 gene or a susceptibility to the disorder. The MCHR1 protein or polynucleotide is useful for preparing a medicament for treating or preventing obesity related to the presence of a molecular variant of the MCHR1 gene. This polynucleotide represents an MCHR1 primer of the invention.
Sequence 18 BP; 5 A; 2 C; 7
                                                                                                                                                                                                                                                                                                                                                                                                                                 The polynucleotide composition comprises: a sequence encoding a polypeptide with defined sequences given in the specification; a secapable of hybridizing to a melanin-concentrating hormone receptor (MCHR1) gene; a polynucleotide encoding an MCHR1 polypeptide; or a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV;GPVI) DNA which is located at chromosomal position 19q13.4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           25-NOV-2002; 2002US-0429136P

Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the ICAM, MAPKIO, KIAAO861, NUMA1 or GALE regions which are associated with breast cancer in a nucleic acid sample
                                                                                                                                                           from a subject.

6 98; 289pp; English.

of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) the invention which was used to genotype human Rho family guanine-nucleotide exchange factor KIAAO861 gDNA which has been mapped to The invention relates to a novel method for identifying a subject at of breast cancer comprising detecting the presence or absence of one chromosomal position 3q27.3. , S of f

New human teratocarnogenesis related protein and its coding sequence.

Example 1; Page 10; 21pp; Chinese.

The present invention describes the human teratocarcinogenesis related protein, designated hTera, which is expressed in normal human marrow. Also described is a method for the preparation of the hTera protein and nucleic acid sequences, and a method of detecting human hTera nucleic acid and polypeptide sequences in sample. The present sequence represent a PCR primer used in the isolation of hTera in an example from the a PCR primer used present invention represents and

                                                                                                                                                           The present invention relates to the isolation of novel human and mouse VMGLOM polypeptides (long form and short form), and the nucleic acid molecules encoding them. VMGLOMs (also referred to as glomulins) are a subtype of venous malformations (VMs) called glomangiomas. In humans, VMGLOM has been mapped to chromosome 1p21-22. VMGLOMs and the nucleic acids encoding for them are useful as a medicament or for incorporation into a diagnostic kit. Such medicaments are useful for preventing, treating or alleviating disorders with a vascular component, particularly where alteration of vascular smooth muscle cell phenotype is needed, e.g. varicosities, cardiopathies or cardiomyopathies, cerebral disorders and cancer. The nucleic acids are also useful in gene thorapy. The present sequence for PCR primer 1 is used to amplify PAC 812f10 (54 T7) clone STS
                                                                                                                                                                                                                                                                                                                                                                                     New VMGLOM genes and polypeptides, useful in gene therapy or for preventing, treating or alleviating disorders with vascular component, e.g. varicosities, cardiopathies, cerebral disorders or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; VMGLOM; glomulin; venous malformation glomangioma; PCR primer; STS; sequence tagged site; PAC 812f10; ss.

The invention also details methods for testing toxicity of substances on the human liver cells and the metabolic conditions of substances by the liver cells. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC contain the variant nucleic acid, an isolated are a delta opioid receptor variant concerns the polyment of the mucleic acid, an isolated antibody that specifically concerns the delta opioid receptor variant, a vector comprising the containt of the polymential the vector, producing the polymential of the polymential of the mucleic acid, diagnosing an agent which conditates the expression of the nucleic acid, diagnosing a genetic predisposition to an eating or energy homeostasis disorder by detecting the presence or absence of the variant nucleic acid in a patient sample, can allele specific primer that detects a polymorphism in the gene concoding a delta opioid receptor associated with an eating or energy contain the variant nucleic acids. The variants are named OPRDI-1 to contain the variant nucleic acids. The variants are named OPRDI-1 to contain the variant opioid receptor gene is located on chromosome 1. The nucleic acid molecules and delta opioid receptor variant are useful for diagnosing a genetic predisposition to an eating or energy homeostasis contact with the disorder cited. The present sequence is a sequencing cand bcR primer used to resequence the human delta opioid receptor gene and pcR primer used to resequence the human delta opioid receptor gene as sincle only enothism (SNP)

12-OCT-2001;
                                                                                                                                                                                                                                                                                 The invention describes a method of selecting genetic markers as targets for nucleic acid sequence amplification comprising selecting each of the genetic markers according to a heterozygosity index of 0.5 or greater. Selecting and amplification of genetic markers are useful as targets for nucleic acid sequence amplification, for genetic testing or facilitating multiplex PCR amplification from limiting amounts of target nucleic acid. The methods are also useful for improving genetic diagnostic acid. Screening methods, such as prenatal diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful in forensic analysis of degraded, old, ancient and difficult samples that are difficult to amplify and identify. This sequence represents a PCR are difficult to amplify and identify.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Selecting genetic markers as targets for nucleic acid sequence amplification, useful for improving genetic testing, e.g. fetal sex determination, comprises selecting each of the genetic markers accorderermination.
                                                                                                                                                                                                                                 Sequence 19.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 36; Page 39; 64pp; English.

The novel nucleic acid molecule has polymorphisms in the serotonin receptor 1D, delta-opioid receptor, or dopamine receptor D2, which is useful in diagnostic and prognostic assays for eating disorders, in particular anorexia nervosa and bulinia nervosa. This polymucleotide sequence represents a opioid receptor 1D PCR primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and

including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addisease, atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by wycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases Sequence breast. The invention relates to a kit for diagnosing and treating The present sequence represents a Vbeta gene repeat sequence. 19 BP; 3 A; 0 C; 0 G; 16 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 1621
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC The invention relates to a kit for diagnosing and treating T-cell CC associated diseases which comprises a panel of nucleic acid primers CC specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CNA. The kit is useful for diagnosing organ transplant CC rejection and diagnosing and treating T-cell associated diseases, CC uncluding autoimmune diseases, degenerative nervous system diseases, CC graft versus host diseases, hypersensitivity diseases, infectious diseases, CC and neoplastic diseases. Autoimmune diseases include Addison's disease, CC atrophic gastritis. Degenerative nervous system diseases include multiple complete control of the control

                                                                                                                                                                      hair growth modulator
```

Example; SEQ ID NO 52; 121pp; English.

The present invention describes a method (M1) for identifying a hair comprises identifying a P-cadherin modulator, and testing whether the P-cadherin modulator is functional as a hair growth commodulator. Also described: (1) a hair growth modulator (1) identified by (M1); and (2) a composition (II) for modulating hair growth, comprising, as an active ingredient, a P-cadherin modulator functional as a hair composition (II) have endocrine and depilatory activities, and can be used as hair growth modulators, P-cadherin function composition, and in gene and antisense therapy. (M1) is useful for modulators, and in gene and antisense therapy. (M1) is useful for confidentifying a hair growth modulator. (I) is useful in a method of medical treatment. (I) or (II) is useful for modulating hair growth for noncetterapeutic cosmetic purposes which involves administering to a subject, (I) or (II). (I) can be used in the manufacture of a medicament for the therapeutic modulation of hair growth. (I) or (II) is useful for treating (II) comprising P-cadherin inducer is useful for correction of hair loss in congenital hypotrichosis associated with juvenile macular dystrophy (HJMD) and other alopecia patients. The present sequence represents a PCR primer human P-cadherin, which is used in an example from the present convention.

The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 4 primer pairs are shown in hAQ9545-480 and hAQ95559-590. The chromosomal markers, published size range of the allele and degree of heterozygosity in the population for the markers covered by these primer pairs are not given in the sneaffication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM into throughout the human genome which can be detectably labelled.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (le. a difference in the number of repeats) between individuals, the markers car be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 6 primer pairs are shown in AAQ95639-686. The published size range of the D8S265 allele is 284-307 bp, and the degree of heterozygosity in the population is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; inflammatory bowel disease; Crohn's disease; ulcerative colitis single nucleotide polymorphism; SNP; chromosome 19p13; paternity test; chromosome 5q31-33; forensic test; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 20 BP; 3
                          The present invention describes a method for detecting the presence polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to d the presence of genetic polymorphisms associated with inflammatory b disease and correlating their occurrence with disease states. They used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                       Testing for the present bowel disease, using

                                                                                                                                                      The present invention describes a method of arraying genome clones. The comptises: (a) clones of the genomic libraries contained in compliked plates numbered for discrimination are mixed in each of the compliked plates; (b) a primer designed based on the chromosome marker complified product to specify the marker is detected from the resultant complified product to specify the discrimination Nos. of the multiwell complified product to specify the discrimination Nos. of the multiwell complified product to specify the discrimination Nos. of the multiwell complified product to specify the discrimination Nos. of the multiwell complified product to specify the discrimination Nos. succeed to the maximum in the specified discrimination Nos. to succeed to the maximum in the specified discrimination Nos. to array the multiwell complates; (e) the clones in the multiwell plates of the specified condiscrimination Nos. are mixed respectively in each wells of longitudinal complates; (e) the clones are specified by using the above primer; (g) signals complated and the specified from the detected result; and (i) the clones are multiwell plates are specified from the detected result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL4957 to ABL45322 represent pCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention

                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for identifying subjects at risk of developing thrombotic thrombocytopenic purpura (TTP) disease, comprising providing nucleic acid having a disintegrin and metalloproteinase containing thrombospondin 1-like domains 13 (ADAMTS13) gene from a subject, and detecting the presence or absence of one or more variations in the ADAMTS13 gene. The method of the invention has thrombolytic and haemostatic activity. The methods and compositions of the present invention are useful for the diagnosis and treatment of, and/or analysing risks for thrombotic thrombocytopenic purpura. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying risk of developing thrombotic thrombocytopenic purpura disease, using a novel disintegrin and metalloproteinase containing thrombospondin 1-like domains genes and proteases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; thrombotic thrombocytopenic purpura; TTP; disintegrin; metalloproteinase; thrombospondin 1-like domains 13; ADAWTS13; thrombolytic; haemostatic; PCR; primer; RT-PCR; 5' RACE; 3' RACE; se

                                                                                                                                                                                                             The present invention describes a compound 8-50 nucleobases in length cargeted to, and which specifically hybridises with a nucleic acid completule encoding HKR1, and inhibits the expression of HKR1. Also cestified (1) a compound 8-50 nucleobases in length that specifically comporibed; (1) a compound 8-50 nucleobase portion of an active site on a curie acid molecule encoding HKR1; (2) a composition comprising the compound and a carrier or diluent; (3) a method for inhibiting the compound and a carrier or diluent; (3) a method for inhibiting the compound and the compound so that expression of HKR1 is inhibited; and (4) a curie with the compound so that expression of HKR1 is inhibited; and (4) a curie with HKR1 by administering to the animal a therapeutic or prophylactic amount of the compound so that expression of HKR1 is inhibited. HKR1 can insense oligonucleotides have cytostatic activities and can be used as CHKR1 inhibitors. The compound, composition and methods are useful for treating a disease or condition associated with HKR1, such as a composition of HKR1 inhibitors. The compound, composition and methods are useful for treating a disease or condition associated with HKR1, such as a composition of HKR1 inhibitors for modulating the expression of HKR1. They are also useful in research and composition shows the expression of HKR1. The present sequence continuenting the expression of HKR1. The present sequence continuenting the useful of the present sequence continuenting the useful of the inhibition of human HKR1 in an antisense continuenting the useful in the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR

                            Ś
                                                                                                                                                                                      Critically hybridise to and inhibit the expression of the nucleotides that compounds oligonucleotide domain 1, NOD1 protein. NOD1, also known as CARD4 (Caspase associated recruitment domain 4) is a domain that is involved in the elimination of cells via programmed cell death and in the host compounds of the administration of cells via programmed cell death and in the host compounds of the administration of cells via programmed cell death and in the host compounds of the administration of cells via programmed cell death and in the host compounds of the administration of cells of the cell death and in the host compounds of the contribute of the development of the conditions including compounds of the contribute to the development of cancer, autoimmune disorders and contribute to the development of cancer, autoimmune disorders and contribute to the development of cancer, autoimmune disorders and conjugurations. The present invention describes antisense coligonucleotides that can modulate NOD1 expression (and variants coligonucleotide sequence is the compounds, via gene therapy, can be used to creat various human diseases caused by aberrant apoptosis. This coligonucleotide sequence is the chimeric antisense oligo used to inhibit compounds. The nucleotide contribute of the invention. Note that it has two compounds. The aim of the invention state that it has two compounds.

                                                                                                                                                                                                                                                                                                                                                         and hepatotropic activity. A polynucleotide of the invention may have a use in gene therapy, or in a vaccine. The compound capable of modulating the level of activity of the OAS, RNase L or 2'-5' phosphodiesterase gene and/or activity of the OAS, RNase L or 2'-5' phosphodiesterase protein is useful in the manufacture of a medicament for treating a patient with or at risk of hepatitis C infection. The nucleic acid that hybridises selectively to OAS nucleic acid is useful in the manufacture of a medicament or diagnostic reagent for treating or diagnosting a patient with or at risk of hepatitis C infection. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of a compound capable of modulating the level of activity of the OAS, RNase L or 2'-5' phosphodiesterase gene or protein in the manufacture of a medicament for treating a patient with or at risk of hepatitis C
Human; antisense; lung dysfunction; nasal airway dysfunction;

CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antinflammatory steroid and ubiquinone. A composition of the invention CC has antinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or CC preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antinflammatory steroid in a subject, for reducing or depleting levels of an CC of, or reducing sensitivity to adenosine, reducing levels of adenosine CC receptor, producing bronchodilation, increasing levels of adenosine CC lung surfactant in a subject's tissue, or treating bronchoconstriction. CC lung inflammation, lung allergies, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed constriction, but was obtained in electronic format directly from WIPO

cc expression of a target polypeptide associated with lung airway or lung cysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition CC of the invention has antiallergic, antialfammatory, antiasthmatic, CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a CC treating a respiratory, lung or malignant disease. The administered CC composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to correct the administered CC uniformation, allergies and/or bronchoconstriction and/or lung CC inflammation, allergies and/or bronchoconstriction and/or lung CC inflammation, allergies, asthma, impeded respiration, respiratory hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary the reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system cc e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effect due to it

                                                                                                                                                                                                                                                                                   This invention relates to novel single nucleotide polymorphisms within Cthe human CARD4 gene. Specifically, it refers to allelic variants of CC CARD4 (NOD1), a member of the CED4/Apaf-1 family that is involved in CC caspase-9 induced apoptosis and inflammation. The present invention CC describes a kit for determining the allelic variants of CARD4 polymorphic CC regions of an individual, which can be useful for predicting CC susceptibility, as well as diagnosis, prevention and treatment of various disorders including chronic obstructive pulmonary disease, rheumatoid CC arthritis, inflammatory bowel disease, psoriasis or asthma. Accordingly, CC the compositions of this invention exhibit antiasthmatic, antiinflammatory and antiallergic activities. Purthermore, they may be used to identify patients that would be strong candidates for effective creatment with a CARD4 modulator, in pharmacogenomics, or in monitoring Ct the effects of CARD4 therapeutics during clinical trials. The nucleic carid molecule may also be used in forensics or paternity testing. This coligonucleotide sequence is a PCR primer used to amplify a human CARD4 DNA oligo comprising an allelic variant of the invention.
                                                                                                   Matches
                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inflammation; chronic obstructive pulmonary disease; rheumatoid arthritis; inflammatory bowel; psoriasis; asthma; antiasthmatic; antiinflammatory: Antiallamia.

                                                                                                                                   The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding LIM domain kinase 1. The compound specifically hybridises with the nucleic acid molecule encoding LIM domain kinase 1 and inhibits the expression of LIM domain kinase 1. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule encoding LIM domain kinase 1. The antisense oligonucleotide is useful for modulating the expression of LIM domain kinase 1 in cells or tissues to treat diseases associated with their expression, such as a developmental disorder or a neurological disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human LIM domain kinase 1 antisense oligonucleotide.
                                                                                                             Sequence 20
                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides for modulating LIM domain kinase 1 expression, useful for diagnosing, preventing or treating conditions associated with the kinase, e.g. neurological or developmental disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  18-JUL-2002; 2002US-00199199

                                                                                                                                                     The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding LIM domain kinase 1. The compound specifically hybridises with the nucleic acid molecule encoding LIM domain kinase 1 and inhibits the expression of LIM domain kinase 1. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule encoding LIM domain kinase 1. The antisense oligonucleotide is useful for modulating the expression of LIM domain kinase 1 in cells or tissues to treat diseases associated with their expression, such as a developmental disorder or a neurological disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides for modulating LIM domain kinase 1 expression, useful for diagnosing, preventing or treating conditions associated with the kinase, e.g. neurological or developmental disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens

The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (CDP), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway in the content of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory

New antisense compound, having a sequence targeted to a nucleic avencoding mPGES-1, useful for preparing a composition for treating inflammation, Alzheimer's disease, arthritis, diabetes, cancer or ischemia acid e.g.,

Gierse

WPI; 2004-305094/28.

Claim 4; SEQ ID NO 1558; 132pp; English.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of thibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic ophthalmological, immunomodulatory and cardiovascular activities, and cophitalmological, immunomodulatory and cardiovascular activities, and cophitalmological, inhibitors and in gene therapy. The antisense compoundant of the preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, ophthalmic, immunological, cardiovascular or neurological disorder. antisense compound vasotropic, ties, and ca

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; ss; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-5; CCR1; CCR3; Eotaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PDE4 A; PDE4 B; PDE4 C; PDE4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; alivay inflammation; allergy; impeded respiration; cystic fibrosis; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction.
                                                                                                                                                                                                                                         Novel single or multiple target oligonucleotide anti-sense to e.g. Conitiation codon, intron of respiratory disease-relevant gene e.g. CORANTES, MCP4, useful for prophylaxis or treating respiratory disease
                                                                                                                                                                                                                                                                                                                                 Nyce JW, Sa

                                                                                                                                                tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
                                                                        allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the

Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the ICAM, MAPK10, KIAA0861, NUMA1 or GALE regions which are associated with breast cancer in a nucleic acid sample subject.

Example 4; Page 83; 289pp; English

The invention relates to a novel method for identifying a subject at ri of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer of fi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the invention which was used to genotype human intercellular adhesion molecule ICAM-1/ICAM-4/ICAM-5 gDNA. ICAM-1 (human rhimovirus receptor;BB2 ;CD54;cell surface glycoprotein p3.58) has been mapped to chromosomal position 19p13.3-p13.2; ICAM-4 (Landsteiner-wiener blood group;LW) has been mapped to chromosomal position 19p13.2-cen and ICAM-5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        alpha-methylacyl-CoA racemase; AMACR; fat gene therapy; antisense; 2'-methoxyethyl phosphorothioate backbone; ss; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                       The invention relates to a novel compound having a sequence comprising 8-80 bp which is targeted to a nucleic acid encoding alpha-methylacyl-CoA racemase (AMACR), specifically hybridises with the nucleic acid encoding alpha-methylacyl-CoA racemase and inhibits the expression of alpha-methylacyl-CoA racemase and inhibits the expression of alpha-methylacyl-CoA racemase. The oligonucleotide compound of the invention may be useful for preparing a composition for treating a disease or condition involving defects in fatty acid metabolism, possibly via gene therapy. The current sequence is that of a antisense 2'-methoxyethyl (2'-MOE) gapmer oligo of the invention which was targeted to human AMACR RNA.
                                                                                                                                                                                                                                                                                                                                                                                       New oligonucleotide compound that inhibits expression of alpha-methylacyl-COA racemase, useful for preparing a composition for treating a condition involving defects in fatty acid metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense 2'-MOE gapmer targeted to human AMACR RNA -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-SEP-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ADP56753;
                                                                                                                                                                                                                                                                                                                                     Example 15;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2004-468694/44.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 10-DEC-2002; 2002US-00316540

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel compound having a sequence comprising 8. 80 bp which is targeted to a nucleic acid encoding alpha-methylacyl-CoA racemase (AMACR), specifically hybridises with the nucleic acid encoding alpha-methylacyl-CoA racemase and inhibits the expression of alphamethylacyl-CoA racemase. The oligonucleotide compound of the invention may be useful for preparing a composition for treating a disease or condition involving defects in fatty acid metabolism, possibly via gene therapy. The current sequence is that of a human AMACR DNA of the

The products of the invention have cytostatic and antithyroid activity and can be used in gene therapy. Nucleic acids, polypeptides, and antibodies of the invention may be used in the diagnosis and/or the therapy of the malfunction of the thyroid and/or hyperlasis of the thyroid and/or thyroid tumors. They may also be used in the production of medicaments. (N1) can also be used to diagnose thyroid tumors which are located on chromosome 19 at band 19q13. This sequence represents a PCR primer used in the isolation of the thyroid malfunction-associated protein, RITA

Isolated nucleic acid molecules having polymorphisms in known human gere.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 8; Page 112; 714pp; English.

CC cytochrome P450 0ZE1 (CYPA500ZE1), adrenergic receptor betai (ABRI), CC caryl hydrocarbon (AHR), aryl hydrocarbon receptor betai (ABRI), CRISS), cycloxygenase 2 (CXXX), diazepam binding CC inhibitor (DB1), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating CC protein (FRAP), glutathione-S-transferase 2 (CXXX), histamine-N-methyl CC transferase (NNMT), (Kallikrein 2) KIKZ, nicotinamide -N-methyl CC transferase (NNMT), NADEH quinone oxidoreductase 2 (NQO2), CC transferase (NNMT), NADEH quinone oxidoreductase 2 (NQO2), CC transferase (NNMT), NADEH quinone oxidoreductase 2 (NQO2), CC transferase (UGT2B15), urckinase receptor (NPA), ultidrug resistance in CC (NDR1), lactotransferin (LTP), multidrug resistance associated protein 3 (CMPR1), cryptases and contained in CYP4501A, This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),

CC This invention relates to the sequence of an isolated nucleic acid CC molecule comprising at least one base variation from that of a known CC human cytochrome P450 A1 (CYP450HA1), cytochrome P450 A2 (CYP450HA1), caryl hydrocarbon receptor beta1 (ADBR1), CC cytochrome P450 (AHR), aryl hydrocarbon receptor nuclear translocator CC (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding CC inhibitor (BBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating CC protein (FNAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl CC transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2), methyl CC (UGT2B4), UDP-glucuronosyl transferase 2B4 (CC (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B1), UDP-glucuronosyl (UGT2B1), unokinase receptor (UPA), multidrug resistance 1 (MRR1), lactotransferrin (LTF), multidrug resistance associated protein 3 (CC (MRP3), orphan nuclear receptor (NR112), or acetylcholine muscarinic CC receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence. The polymorphisms in the human genes cited in the invention are useful as CC genetic linkage markers for locating and characterising the genes that CC identifying the genes responsible for a variety of disorder-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               w rulman; ws; primer; cycontrolle Fabora; check of the cytochrome P450 A2; CYC04501A2; CYC04rome P450 OZE; CYC4500AE1; LTF; cytochrome P450 OZE; CYC4500AE1; LTF; was adrenergic receptor beta1; ADBR1; aryl hydrocarbon; AHR; wRP3; wR112; waryl hydrocarbon receptor nuclear translocator; ARNT; cathepsin S; CTSS; waryl hydrocarbon receptor nuclear translocator; ARNT; cathepsin S; CTSS; waryl hydrocarbon receptor nuclear translocator; ARNT; cathepsin S; CTSS; waryl hydrocarbon; FLAP; cycloxygenase 2; COX2; diazepam binding inhibitor; DBI; haematological; we poxide hydroxylase 2; EPHX2; 5-lipoxygenase activating protein; FLAP; cycloxyl kallikrein 2; KLKZ; historinamide-N-methyl transferase; whit; was allocatione oxidoreductase 12; GST12; historinamice-N-methyl transferase; whit; was allocatione oxidoreductase 2; NQO2; sulfotransferase thermolabile; STM; was allocation by transferase 2B7; workinase receptor; what was activated protein 3; cancer; prostate; was multidrug resistance associated protein 3; cancer; prostate; multidrug resistance associated protein 3; cancer; prostate; was actylcholine muscarinic receptor; CHMR1; CLMR2; CHMR3; CHMR4; CHMR5; was actylcholine muscarinic receptor; cHMR1; chmR2; CHMR3; CHMR4; CHMR5; was actylcholine muscarinic receptor; chmR1; chmR2; CHMR3; CHMR4; CHMR5; was actylcholine muscarinic receptor; chmR1; chmR5; chmR3; chmR4; chmR5; c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human multidrug
